

GIVE YOUR BUS THE WATER CAPACITY IT DESERVES!

Brothers Sean & Chad Mangold have been RV'ing for over 20 years in remote locations where hook-ups are not available. Over that time, it was clear that there was no available solution that solved the problem they had on every trip – limited tank sizes. These limits reduced their length of stay, limited use of their RV's amenities, and had them constantly worrying about tank levels. After years of development and testing, they solved the problem and decided to share it with the RV world.

“Our boondocking trips always forced us and those around us to resort to water conservation efforts that hindered our experience” says co-founder Sean Mangold. “We knew there was a need for MAX-Tank systems each time we would hear stories of RV'ers limiting their shower time, kitchen sink usage, and even use of the precious toilet because they did not have enough on-board capacity to get through their trip”.

In 2018, MAX-Tank became the first and only provider of auxiliary water systems on the RV market. Just days after launch, MAX-Tank products were requested by a major distributor and became available to the public, offering a complete solution for any type of RV to expand fresh and grey water capacity without any modifications.

MAX-Tank Freshwater System

Co-founder Chad Mangold adds “RV'ers are consistently raising their expectations for having all the amenities that they are used to at home incorporated into their RV and be able to use them to full-potential, even in remote locations. Many of these amenities rely on fresh & grey water supply and storage which can quickly become depleted when staying in a location without full hook-ups. We knew a solution was needed”.

MAX-Tank auxiliary water systems are a great solution for the bus conversion market due to the unlimited possibilities of where to place it and transport it. Whether kept in a compartment like shown above, or in another vehicle, the tanks can be easily filled and held in reserve until the water is needed.

Many users on multi-stop trips will fill or empty their MAX-Tank when they are at a location with hook-ups, and then use it when they are at their next location, which may not have hook-ups. The extra 50 gallons of capacity allows the flexibility to adjust travel plans on the fly.

The ability to refill or empty a bus or RV without having to move it is a gamechanger.

The water transfer process happens at the flip of a switch on the included 12-volt pump, which gets power from the 7-pin connection on any vehicle.

All the system components like hoses and connections are included, allowing for freshwater filling or grey water extraction depending on which system is used.

“We receive a lot of inquiries for unique applications and custom uses. The overlanding community and Sprinter van market has exploded recently, and those folks also quickly realize they need more water than their unit can hold”.

For bus conversions, we know that there is a wide variety of situations that MAX-Tank systems are perfect for. From vintage school buses that were designed without any tanks to modern diesel pushers, MAX-Tanks fit into unique spaces without having to make modifications or worry about connecting plumbing or electrical connections. The systems can also be removed and easily stored when they are not needed.

MAX-Tank utilizes high-density, UV stabilized polyethylene tanks that feature robust bulkheads and brass connections that have been leak tested prior to shipment. The tanks weigh 26 pounds when empty and can easily withstand over 100 pounds of dispersed weight directly on top, so other items can be packed around them without worry of damage.

MAX-Tank systems are shipped UPS anywhere in the U.S., typically arriving in just a few days. They are ready to go right out of the box, with no special tools needed.
